

RTOS Lab WS 2022

Christoph Scholl
University Freiburg

Hard- and Software

- Development Kit with ESP32 Microprocessor
 - Low cost option (< 10 Euro)
 - Compatible with Arduino-IDE or ESP-IDF IDE
 - We will use the ESP-IDF IDE
- Real-Time Operating System: FreeRTOS
 - Open source RTOS
 - Written in C
 - Simple fixed priority scheduling
 - <https://www.freertos.org/>

Task 1 – Getting started

- Get freeRTOS running on development board
 - First install the ESP32 Framework:
 - Follow the setup instructions on the following webpage according to your operating system:
<https://docs.espressif.com/projects/esp-idf/en/latest/esp32/get-started/index.html>
 - A folder named esp-idf will be in the directory of your choice. The following icon will be created on your Desktop

Task 1 – Getting started

- ...

- After having successfully installed the ESP32 Framework, running the ESP-IDF Command Prompt (cmd.exe) should result in the following window.

```
ESP-IDF Command Prompt (cmd.exe) - "C:\Users\diaae\espessif\idf_cmd_init.bat" "C:\Users\diaae\AppData\Local\Programs\Python\Python37\..."
Python 3.7.3
Using Git in C:\Program Files\Git\cmd\
git version 2.21.0.windows.1
Setting IDF_PATH: C:\Users\diaae\Desktop\esp-idf

Adding ESP-IDF tools to PATH...
C:\Users\diaae\.espressif\tools\xtensa-esp32-elf\esp-2019r2-8.2.0\xtensa-esp32-elf\bin
C:\Users\diaae\.espressif\tools\esp32ulp-elf\2.28.51.20170517\esp32ulp-elf-binutils\bin
C:\Users\diaae\.espressif\tools\cmake\3.13.4\bin
C:\Users\diaae\.espressif\tools\openocd-esp32\v0.10.0-esp32-20190313\openocd-esp32\bin
C:\Users\diaae\.espressif\tools\mconf\v4.6.0.0-idf-20190628\
C:\Users\diaae\.espressif\tools\ninja\1.9.0\
C:\Users\diaae\.espressif\tools\idf-exe\1.0.1\
C:\Users\diaae\.espressif\tools\ccache\3.7\
C:\Users\diaae\.espressif\python_env\idf4.0_py3.7_env\Scripts
C:\Users\diaae\Desktop\esp-idf\tools

Checking if Python packages are up to date...
Python requirements from C:\Users\diaae\Desktop\esp-idf\requirements.txt are satisfied.

Done! You can now compile ESP-IDF projects.
Go to the project directory and run:

idf.py build
```

Task 1 – Getting started

- ESP-IDF comes with a FreeRTOS version called ESP-IDF FreeRTOS which is based on Vanilla FreeRTOS v10.4.3
- As a first application, start a few a-periodic tasks and use the internal fixed priority scheduler of freeRTOS to run them
- For doing so, build on the sample installation of freeRTOS in ESP-IDF:
 - Start the ESP-IDF cmd
 - Navigate to directory esp-idf\examples\system\freertos\
 - For building your own application you may first make a backup copy of the existing folder “real_time_stats”
 - Change into directory real_time_stats → main and do modifications (e.g. modify main.c, add new files etc.)
- Run your freeRTOS application:
 - Navigate to directory esp-idf\examples\system\freertos\
 - idf.py build
 - idf.py -p COM4 flash (COM4 is the serial port to which your ESP32 is connected)
 - idf.py -p COM4 monitor > **outputfile**
 - Check the output by looking at file **outputfile** in a text editor

Task 1 – Getting started

- For more information on ESP-IDF FreeRTOS see also <https://docs.espressif.com/projects/esp-idf/en/latest/esp32/api-reference/system/freertos.html>
- For more information on „vanilla“ freeRTOS in general see <https://www.freertos.org/>
- freeRTOS tutorial: https://www.freertos.org/Documentation/RTOS_book.html
- Note:
 - ESP-IDF FreeRTOS is modified for making use of the dual core on ESP32
 - The SMP (symmetric multiprocessing) option is not needed in this lab
 - You should possibly use the option [CONFIG_FREERTOS_UNICORE](#) to run ESP-IDF FreeRTOS only on CPU0.

Task 2 - Visualization

- Visualize the schedule produced by the RTOS
- For logging interesting scheduling events, make use of Trace Hook Macros
 - See <https://www.freertos.org/rtos-trace-macros.html>
 - Be careful: Code inside trace macros should be as fast as possible to avoid overhead during scheduling actions
 - No printf's in trace macros!!!
 - Solution:
 - Inside trace macros write information into memory arrays, without any syscalls etc.
 - Define a suitable file format and print recorded information with printf **after** monitored schedule has been finished

Task 2 - Visualization

- Display logged information graphically
- Interpret the file by a suitable visualization software, see e.g. the python library altair
 - https://altair-viz.github.io/getting_started/installation.html
- I.e. write a small python script that interprets the log file and produces an output like this (e.g.)

Task 3 – Task modeling for a-periodic and periodic tasks

- freeRTOS does not contain a build-in mechanism to directly generate periodic tasks
- Function **vTaskDelayUntil** can be used to model periodic tasks

- See <https://www.freertos.org/vtaskdelayuntil.html>

- Basic example:

```
// Perform an action every 10 ticks.
void vTaskFunction( void * pvParameters )
{
    TickType_t xLastWakeTime;
    const TickType_t xFrequency = 10;

    // Initialise the xLastWakeTime variable with the current time.
    xLastWakeTime = xTaskGetTickCount();

    for( ;; )
    {
        // Wait for the next cycle.
        vTaskDelayUntil( &xLastWakeTime, xFrequency );

        // Perform action here.
    }
}
```

- Task will be blocked by vTaskDelayUntil and unblocked at time xLastWakeTime + xFrequency

Task 3 – Task modeling for a-periodic and periodic tasks

- Two options:
 - Option 1 (should be followed first):
 - Use for each periodic task a „generator task“ running at maximal priority, i.e. a wrapper `start_periodic_task(tau_i, T, P)` with period T , phase P and function pointer `tau_i`
 - The periodic action of the generator task is to generate a new task (instance) with `xTaskCreate` which then gets its own priority
 - Option 2 (less overhead, but does not generate real „task instances“):
 - Model all periodic task instances by **one** task
 - The periodic action is then just a call to function pointer `tau_i`
 - After the call the task is blocked by `vTaskDelayUntil` until „arrival time of next task instance“...
- Provide a wrapper to start a-periodic tasks as well
- Add code to check for time overflows ...

Task 4 – Integrate EDF into freeRTOS

- Follow a simple user-space approach of integrating EDF into freeRTOS (without modifying the OS code)
- Two options:
 - Option 1:
 - Use trace macros which re-compute task priorities according to deadlines whenever a task (instance) is generated or finished
 - Then just use the integrated priority based scheduler
 - Option 2:
 - Use trace macros to manage own ready, blocked, suspended lists in the user space
 - Only two priorities for periodic tasks – the task instance that should be executed next gets maximal priority
 - This approach is followed in **ESFree** developed by Robin Kase in his Master's thesis at KTH Stockholm
 - See <http://kth.diva-portal.org/smash/record.jsf?pid=diva2%3A1085303&dswid=436>
 - <https://github.com/RobinK2/ESFree>
- Deep integration of EDF into freeRTOS OS code - not followed in this lab

Possible Extensions

- Integrate Total Bandwidth Server to schedule periodic and a-periodic tasks together
- Look into priority inheritance (implemented in freeRTOS for mutexes, but not for semaphores)
- Integrate priority ceiling protocol

Additional Tasks

- Always document what you did
 - Among others for later usage in exercises of RTOS lectures
- Lab should also result in something like a small „user manual“ for setting up the system
